

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

NEGST WP4 - pre-normative work

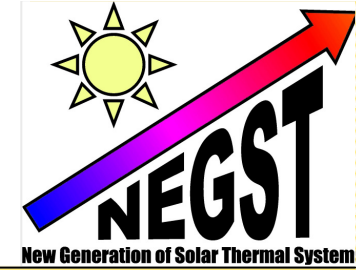

- ***suggestions for improvement of existing standards***
- ***basis for new standards***

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

Why always revise / re-new standards?

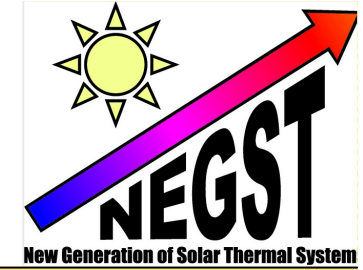

- To remove market barriers for new (and better) products -> growing solar thermal market.
- By nature, standards are always developed with a certain time delay compared with developments of products and systems. This delay may be a barrier for the new products to enter the market, as no testing and certification is possible - or existing standards do not express the benefits of the new products.

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

Subjects treated?

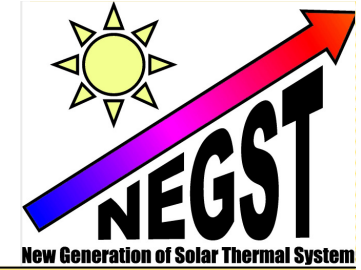

1. Collectors & collector components
2. Stores
3. Controllers
4. Combisystems (DHW+SH)
5. Solar cooling
6. Solar desalination
7. Fluids
8. LCA – Life Cycle Assessment
9. Conversion $m^2 \rightarrow$ power & energy

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

Deliverables

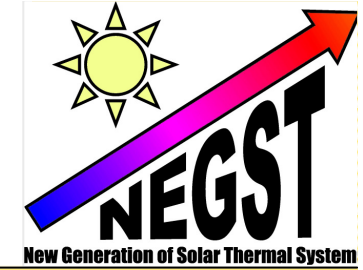

1. Proposals for revisions of EN's
2. Resource documents
3. Indications of "further work needed"

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

Deliverables

Official proposals to CEN TC312:

- CEN/TC 312 resolves to proceed on the creation of a new WI consisting of the revision of EN12975-1 and -2 once the financing is available for the implementation of M/369. In this revision the following topics will be considered:
 - a. clarification of the application of the present standards to **tracking and/or concentrating collectors**
 - b. **unglazed collectors**: refined performance test conditions and prediction, improved sky temperature measurement
 - c. collector components - **requirements and test methods**
 - d. **quality tests for evacuated tubes**
 - e. improved exposure - **accelerated ageing test of collectors**
 - f. (annual collector energy output)

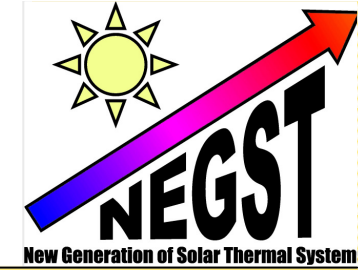

[RESOLUTION 10, CEN/TC 312 - GRAN CANARIA, SPAIN, 2006-04-03 & 04](#)

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

1. Collectors & collector components

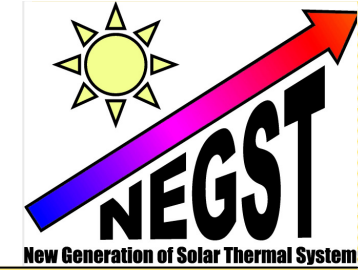

Resource document, guidelines	Characterisation of incidence angle dependencies for tracking and concentrating collectors (guidelines recommended to be included in EN12975 – clarification of the EN12975)
Recommendations for revisions	Un-covered collectors - refined performance test conditions and prediction: more strict limits on long wave irradiation; improved sky temp. measurement; ...
Proposal for new standard / inclusion in EN12975 Resource documents (IEA-SHC)	Quality test of solar absorbers Quality test of polymeric materials in collectors Quality test of reflector materials and anti-reflexive coatings
Recommendations for revisions	Qualification tests for vacuum tubes: exposure, mech. load, reflector durability, impact resistance, freezing, glass/metal seal durability
Draft test procedure	Improved exposure / accelerated ageing test of collectors (AU method with hot oil – to be further evaluated)
Resource document(s) / proposal for revision of EN12975 (Work shop in Austria autumn 2007 – arsenal research)	Air collectors: - recommendations for requirements - recommendations for test methods (based on survey of existing methods) - survey of products in the market and interested companies in development of this type of collectors
Ressource document	Improved performance accuracy (flat plate collectors)

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

2. Stores

Draft test procedure	Test methods for stores with external heat exchangers
Draft revised test procedure	Improvement of parameter identification test methods incl. aspect of verification
Ressource document	Basic principles/concepts to be applied in the development of store test methods

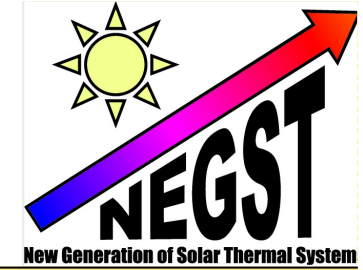

This work is partly used in TC312 / WG3 "Custom built systems" prEN 12977-3 "Storages"

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

3. Controllers

Draft test procedure	Test method for "variable flow controllers" (e.g. constant temperature control.)
Draft test procedure	Simple test method for energy consumption of pumps and controllers
Draft test procedure	Test method for "total controllers" (integrated control of the whole heat production)

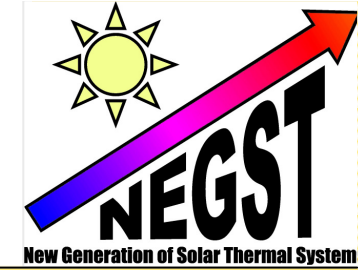

This work is partly used in TC312 / WG3 "Custom built systems" prCEN/TS 12977-5 "Controllers"

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

4. Combi-systems

Ressource document	Testing systems (stores) with integrated burner - "Experience on tests for combi-systems with and without integrated burner"
Draft calculation method	Updated/new method for calculating performance of combi-systems
Draft test procedure	Updated Direct Characterisation (DC) test method
Ressource document	Comparison of different performance test methods; CTSS, AC, DC (Round Robin)

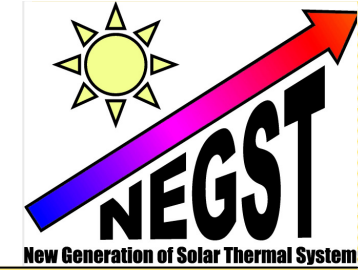

This work is partly used in TC312 / WG3 "Custom built systems" prCEN/TS 12977-4 "Combi-systems"

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

5. Cooling

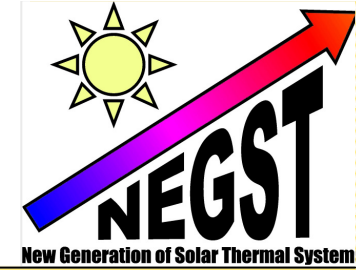

Ressource document	Survey on existing software for simulations of solar assisted air conditioning systems
Ressource document	Survey of existing test methods and standards for A/C systems components and the need to consider its association with solar <ul style="list-style-type: none">- survey on test methods for A/C system components- possibility of reference in CEN/TS 12977

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

7. Desalination

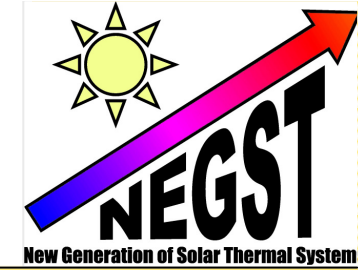

Proposal for TR/TS	Guidelines for materials compatibility (corrosion issues)
Proposal for TR/TS	Guidelines for performance testing of solar systems with desalination units

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

8. Fluids

Proposal for new CEN TC312 work item	"Standards for solar thermal fluids" - Recommendation for the use of standards for the determination of solar-fluid parameters - Recommended work plan for the elaboration of requirements and testing methods for <u>fluid lifetime</u> / deterioration
---	--

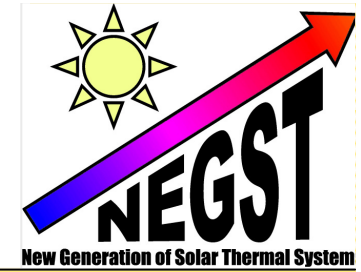

Very nice basis for developing EN-standard for solar fluids – so far nobody wanted to take the lead ...

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

9. Life Cycle Assessment, LCA

Proposal for TS/TR	Method for determination of environmental fact sheet including energy payback time for solar collectors (final decision on subject(s) to be taken)
--------------------	---

		Environmental Fact Sheet for Solar Thermal Systems		Certification No: Example	
Manufacturer: Address: Telephone:		Brand Name:	Type of STS:	Certification performed by: Organisation: Address: Telephone:	
The life cycle environmental assessment is performed according to the NEGST's rules. Reference:					
Results from Life Cycle Inventory Environmental product declaration of the STS unit					
Material used in the STS unit			Emissions and amount of energy as needed during production, maintenance and final disposal/recycling		
Material (normative)	Amount (kg)	Global warming gases (normative)	CO₂-equivalents		
Glass					
Copper		Primary energy use	Amount (kWh)		
Aluminium		Renewable			
Chrome		non-renewable			
Plastic		electricity			
Steel		Total primary energy use (embodied energy) (normative)			
Iron					
Etc.....		Annual collector energy output (normative) (kWh/m², year)			
Etc.....		Tilt angle (degrees)	Collector inlet temperature		
		0	25 °C	50 °C	75 °C
Waste	Amount (kg)	0			
Dangerous waste		30			
Material resources to recycling or burned with heat recovery		45			
		60			
Other waste		90			
Total waste		Values above are given for the location: Athens, Davos, Stockholm or Wursburg			
Environmental Life Cycle Assessment of the STS unit					
Reference system			STS unit (normative)		
Climate application	Athens, Davos, Stockholm or Wursburg	Lifetime of the STS		Years	
Replaced system	Natural gas boiler	Energy Yield Ratio (EYR)		Times	
Efficiency	85 %	Avoided global warming impact		CO ₂ -Equivalents	
Reference system			STS unit		
Replaced system		Energy Yield Ratio (EYR)		Times	
Efficiency		Avoided global warming impact		CO ₂ -Equivalents

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

10. m² -> power & energy

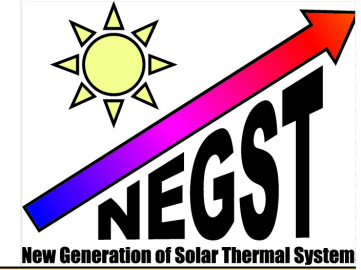

Resource document (now generally accepted procedure)	Method for "Conversion of m ² to power"
Resource documents	Methods for "Conversion of m ² and power to energy"

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

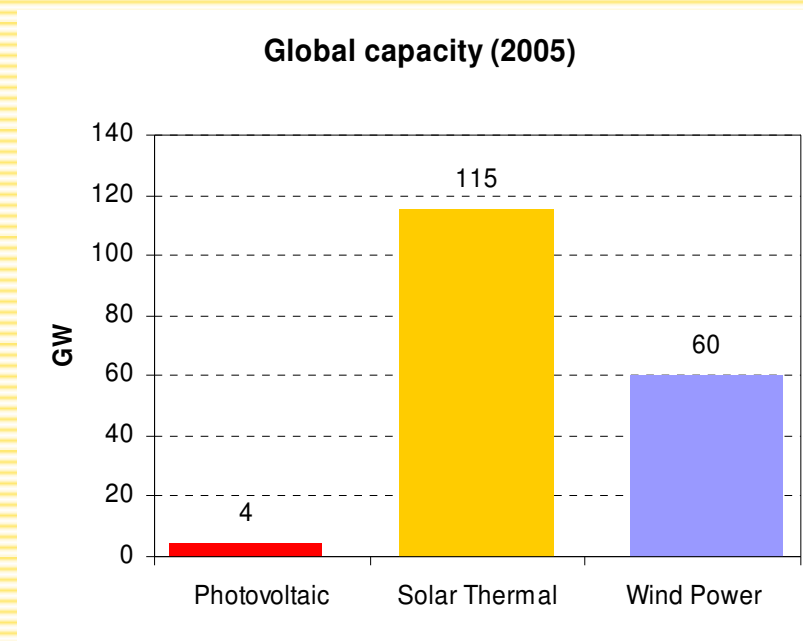

10a. m² -> power

**Conversion of m² to
power capacity:**

$$P = 0.7 \text{ kW/m}^2$$

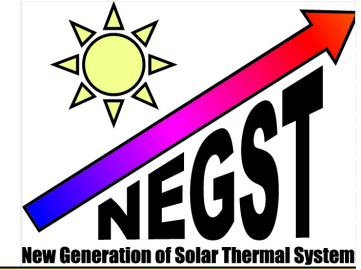

Generally accepted !

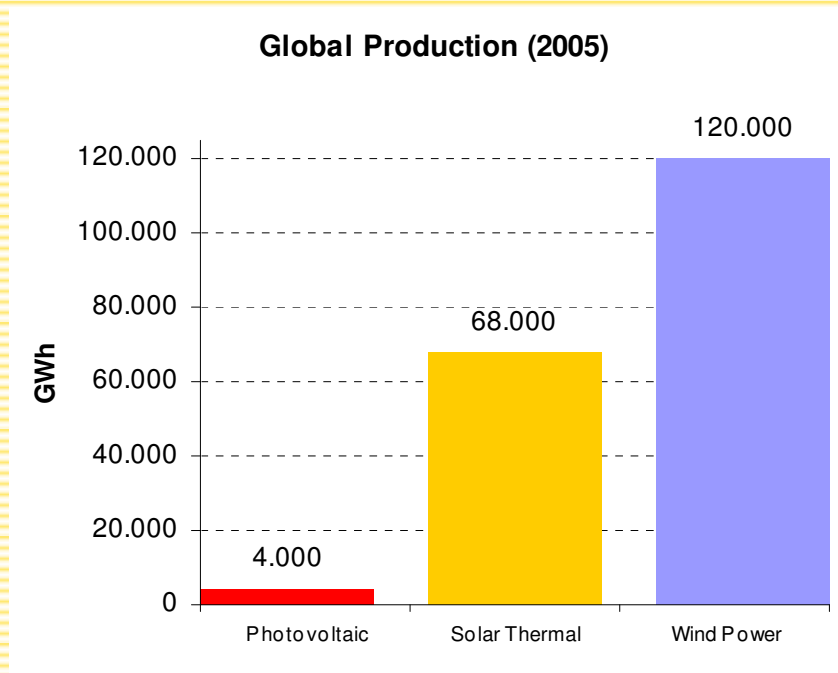

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

10b. power -> energy

**Conversion of power
capacity to annual
energy production**

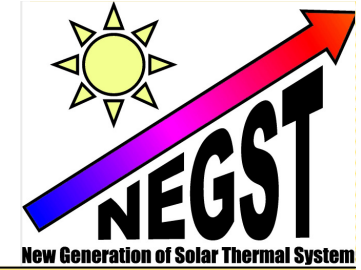

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

10b. power -> energy

IEA-SHC World statistics – main EU markets:

Very good correlation of annual collector energy production (glazed collectors) and **global horizontal irradiation**:

$$Q = 0.6 * G_0 * P$$

Equivalent full load hours: $0.6 * G_0$

$$Q = 0.42 * G_0 * A$$

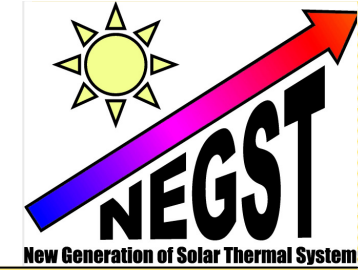

Efficiency: 42% related to **global horizontal radiation**

NEGST InterSolar Work Shop, Freiburg, June 2007

Towards the next generation of standards for solar thermal systems

J.E. Nielsen, SolarKey Int., ESTIF Technical Consultant

10b. power -> energy

Overall Europe:

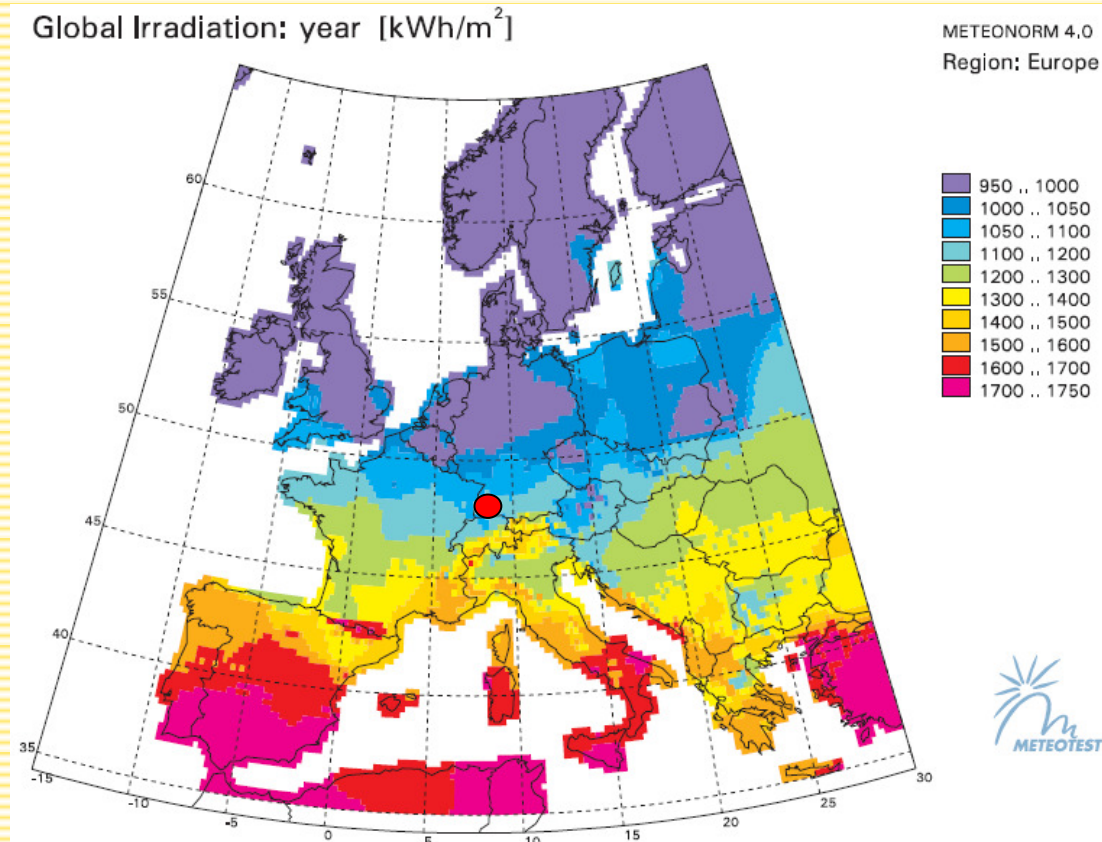

Freiburg: $G_0 \approx 1200 \text{ W/m}^2$

Equivalent full load hours:

$$0.6 * 1200 = 720 \text{ Hours}$$

$$Q = 720 \text{ kWh/kW}$$

$$Q = 720 * 0.7 \approx 500 \text{ kWh/m}^2$$
